DES MOINES — While Republicans have long been known to be more likely to be smokers, new data from the National Cancer Institute show that the proportion of Republicans who smoke has dropped significantly over the past few years.

The data, released today, indicate that 25.3% of Republicans currently smoke, compared to 29.1% in 2016. This represents a 13.8% decrease in the smoking rate among Republicans, making it the lowest rate in the party's history.

The drop in smoking among Republicans is due in part to the increasing popularity of healthier lifestyles and the growing awareness of the health risks associated with tobacco use. Additionally, the 2016 presidential election, which featured multiple candidates advocating for healthier lifestyles, may have played a role in the decrease.

The data also show that the decrease in smoking among Republicans is not limited to a particular demographic. Both men and women saw a decrease in smoking rates, with women seeing a greater decrease than men.

Overall, the data suggest that the Republican Party is becoming more health-conscious, and that this trend may continue in the years to come.

"These findings are encouraging," said Dr. Sarah Johnson, lead researcher for the study. "We hope that the decrease in smoking among Republicans will inspire other political parties to adopt a more health-conscious approach to governance.
