Background Information

- Particulate Matter
 - Mixture of extremely small particles and liquid droplets.
 - Different sizes pose different risks.
- PM 2.5: Why do we care?
 - Emitted from forest fires; also form when gases emitted from power plants, industries and cars react in the air.
 - Health risks
 - Linked to asthma and other respiratory problems.

● Asthma

- Disease that affects the lungs.
- Asthma causes repeated episodes of wheezing, breathlessness, chest tightness, and nighttime or early morning coughing.
- Triggers differ from person to person and consist of house dust mites, tobacco smoke, outdoor air pollution, pets, mold, and other illnesses.

Data

- PM 2.5
 - Monitors at specific sites.
 - Point-source data.
 - Mean annual values for PM 2.5 at these locations.
 - Obtained from Environmental Protection Agency (EPA) website;
<http://www.epa.gov/air/data/index.html>

● Asthma

- How many adults who have been diagnosed with asthma had one or more asthmatic episodes (periods of worsening) in the past year.
- Obtained from the Center for Disease Control and Prevention (CDC).
- Collected as survey.

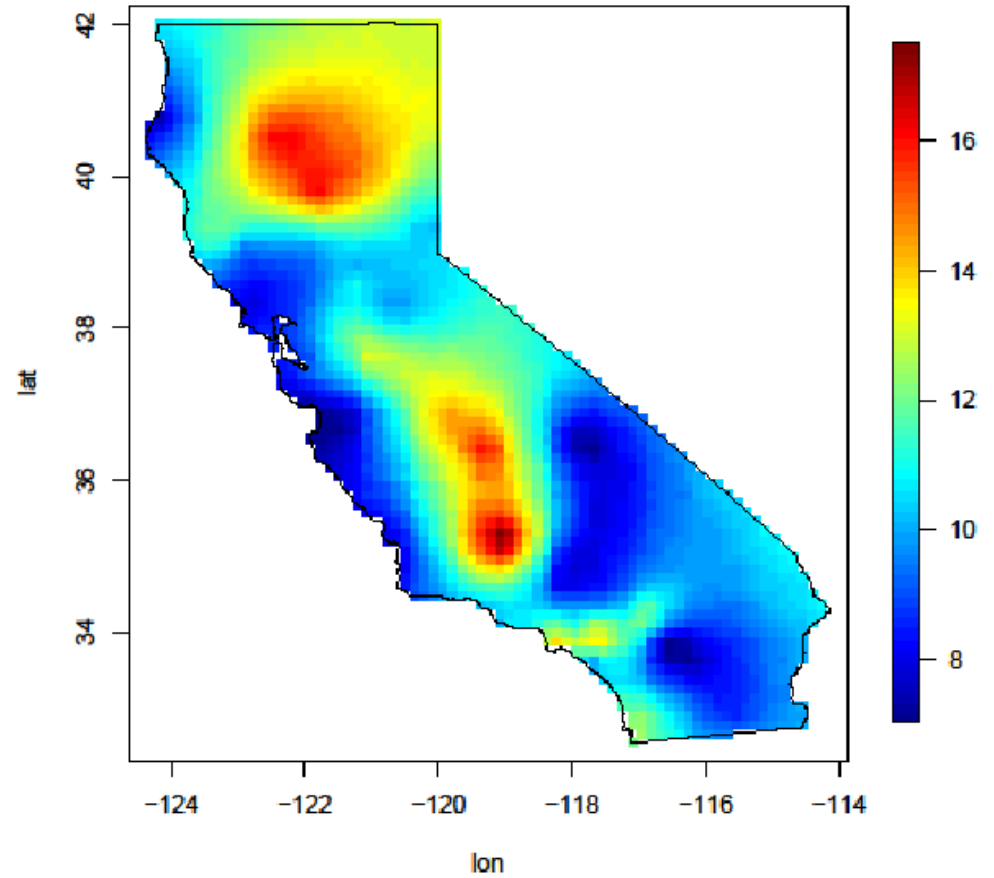

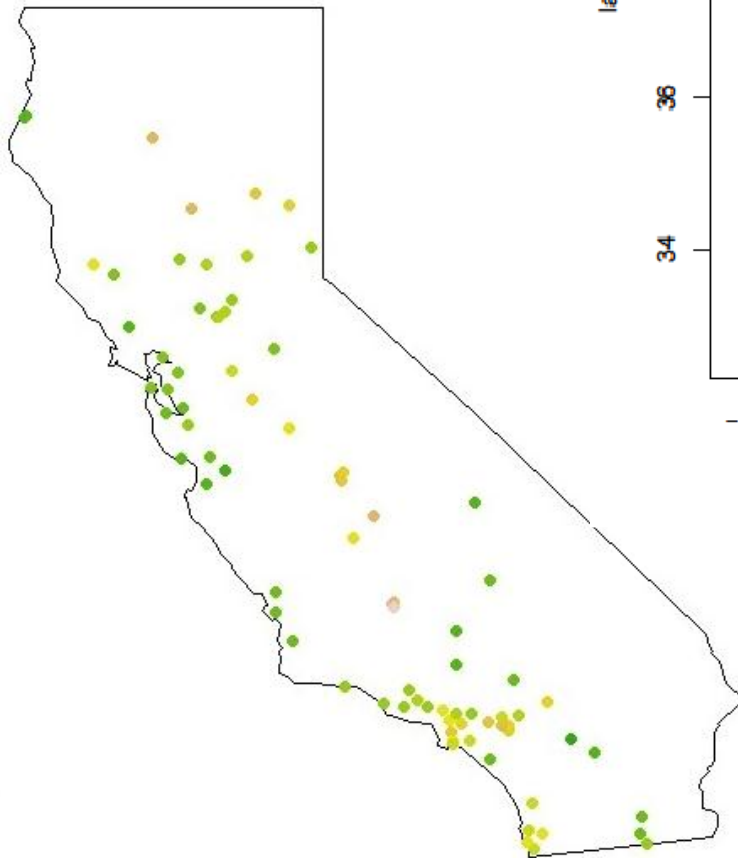

Percent of Episodes Within the Asthmatic Population in 2008 data provided by the CDC

Research Questions

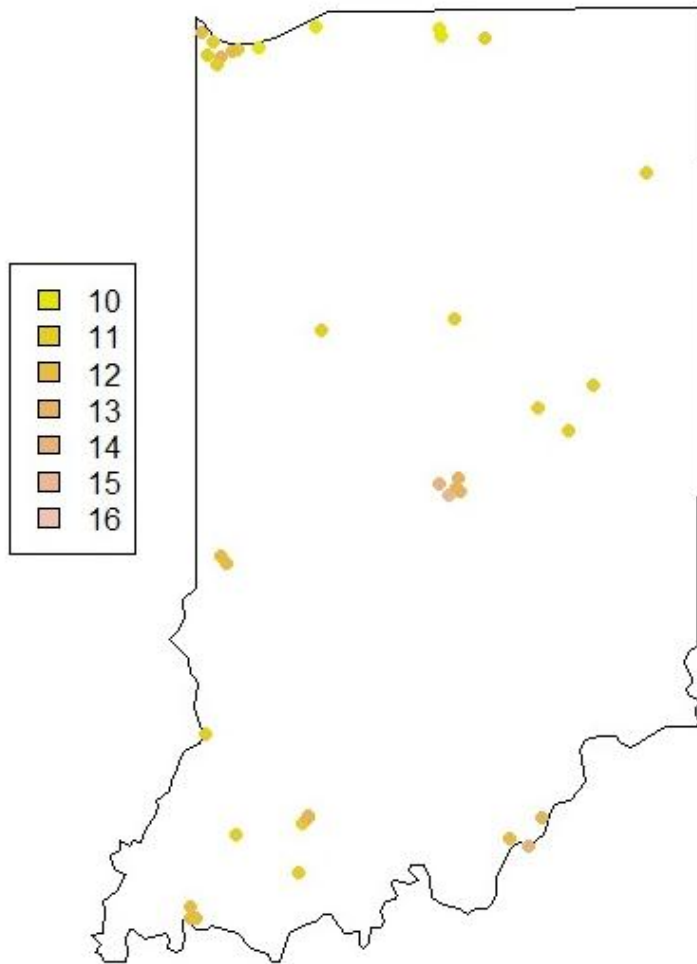

- How can we take the PM 2.5 point source data and produce an estimated surface?
- Are states with more industry more prone to air pollution-according to our maps?
- What does the whole surface of predicted PM 2.5 values look like?
- Is there a visible correlation between the asthma and the particulate matter data?

United States

California

Iowa

Indiana

Scatter plot of asthma control percentages vs. PM 2.5 concentration by state

Results

- Trends in PM 2.5 concentration.
 - States with more industry do have more particulate pollution.
- Correlation value of -0.09 , 95% confidence interval of $(-0.42, 0.26)$ and a p-value of 0.61 ; thus, no correlation between asthma and PM 2.5.

Conclusions

- No significant correlation between asthma control percentages and PM 2.5 data.
 - Asthma data recollection method (survey vs. state registry).
 - People have variable asthmatic triggers and they can limit their time outside if they know that outdoor air pollution is a trigger, which may be why we did not find a correlation.

Future Work

- Estimate the average level of PM 2.5 for each state using the point source data and the ramps and geoR packages.
- Look at specific occupations which pose an increased exposure to PM 2.5 and find a correlation between these and the ability to control the asthma episodes.
- Since particulate matter has been shown to trigger the development of chronic bronchitis, find a correlation between prevalence of this and the state concentrations of PM 2.5.
