Our Project

About
our
Subjects

Parameters

Parkinson's Disease (PD)

- "a brain disorder that leads to shaking, stiffness, and difficulty with walking, balance, and coordination"
- Symptoms usually begin gradually and get worse over time
- affects about 50% more men than women
- No known cure

*** "Control" in our study
refers to those without
PD**

The
Study

PICTURES

Sample Size

The study consisted of 136 participants (part_n):

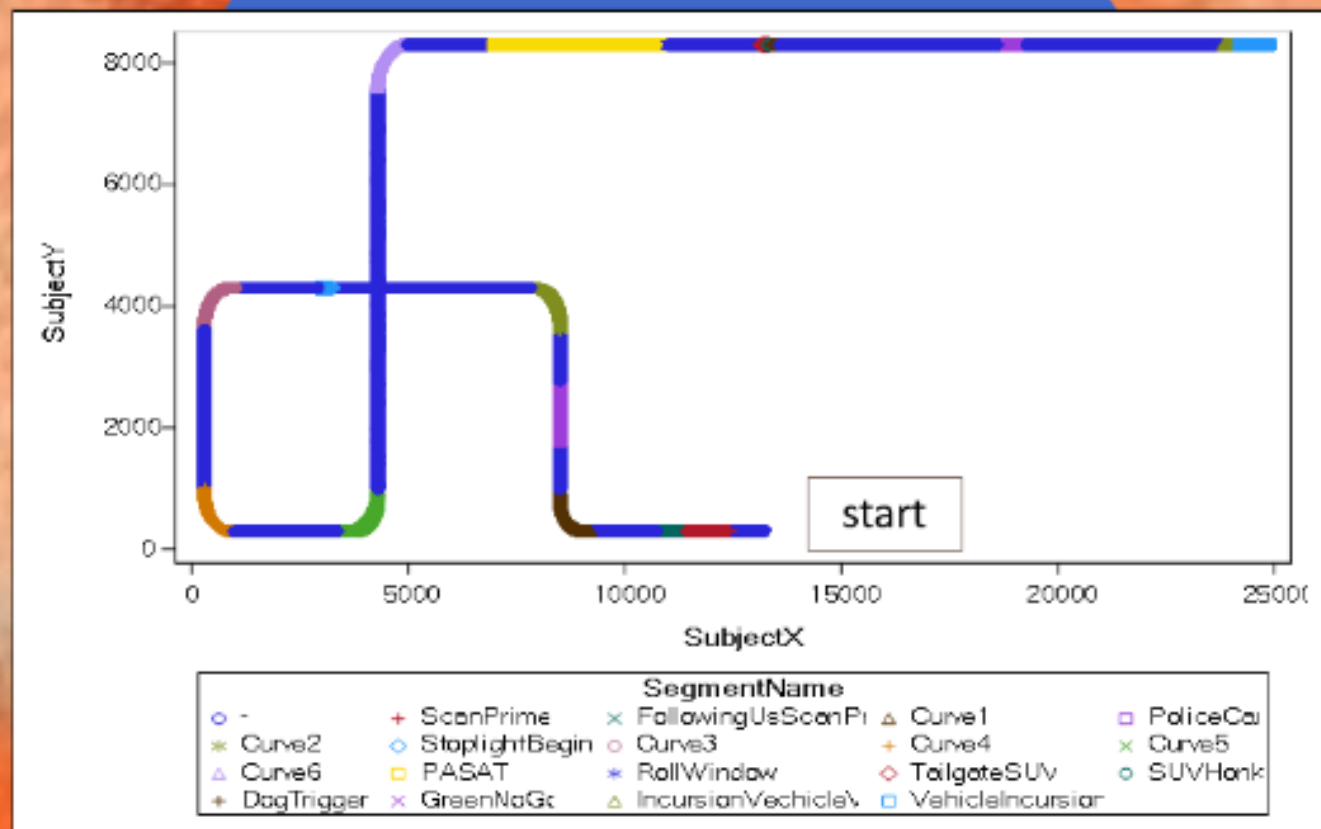

- 71 subjects with PD
- 65 subjects without PD (Control)

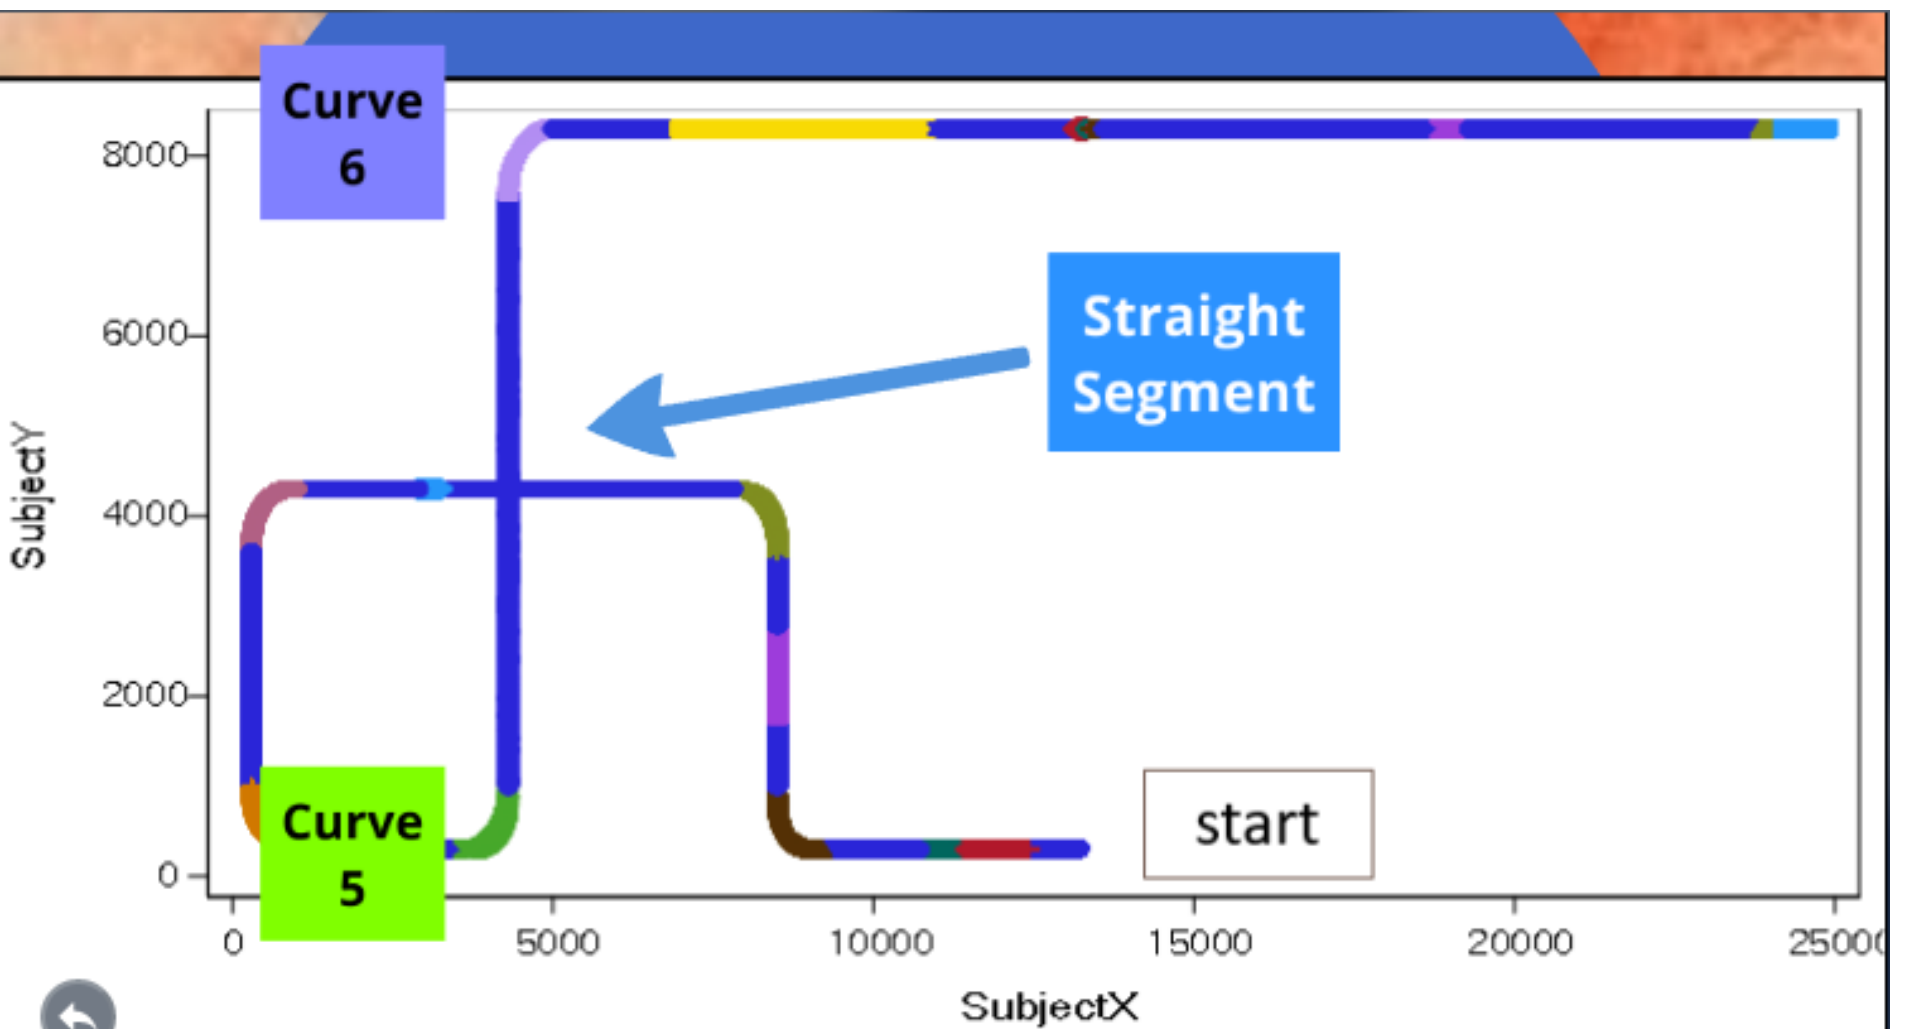

Each subject drove a fixed curved route via the Univ. of Iowa's driving simulator, SIREN*.

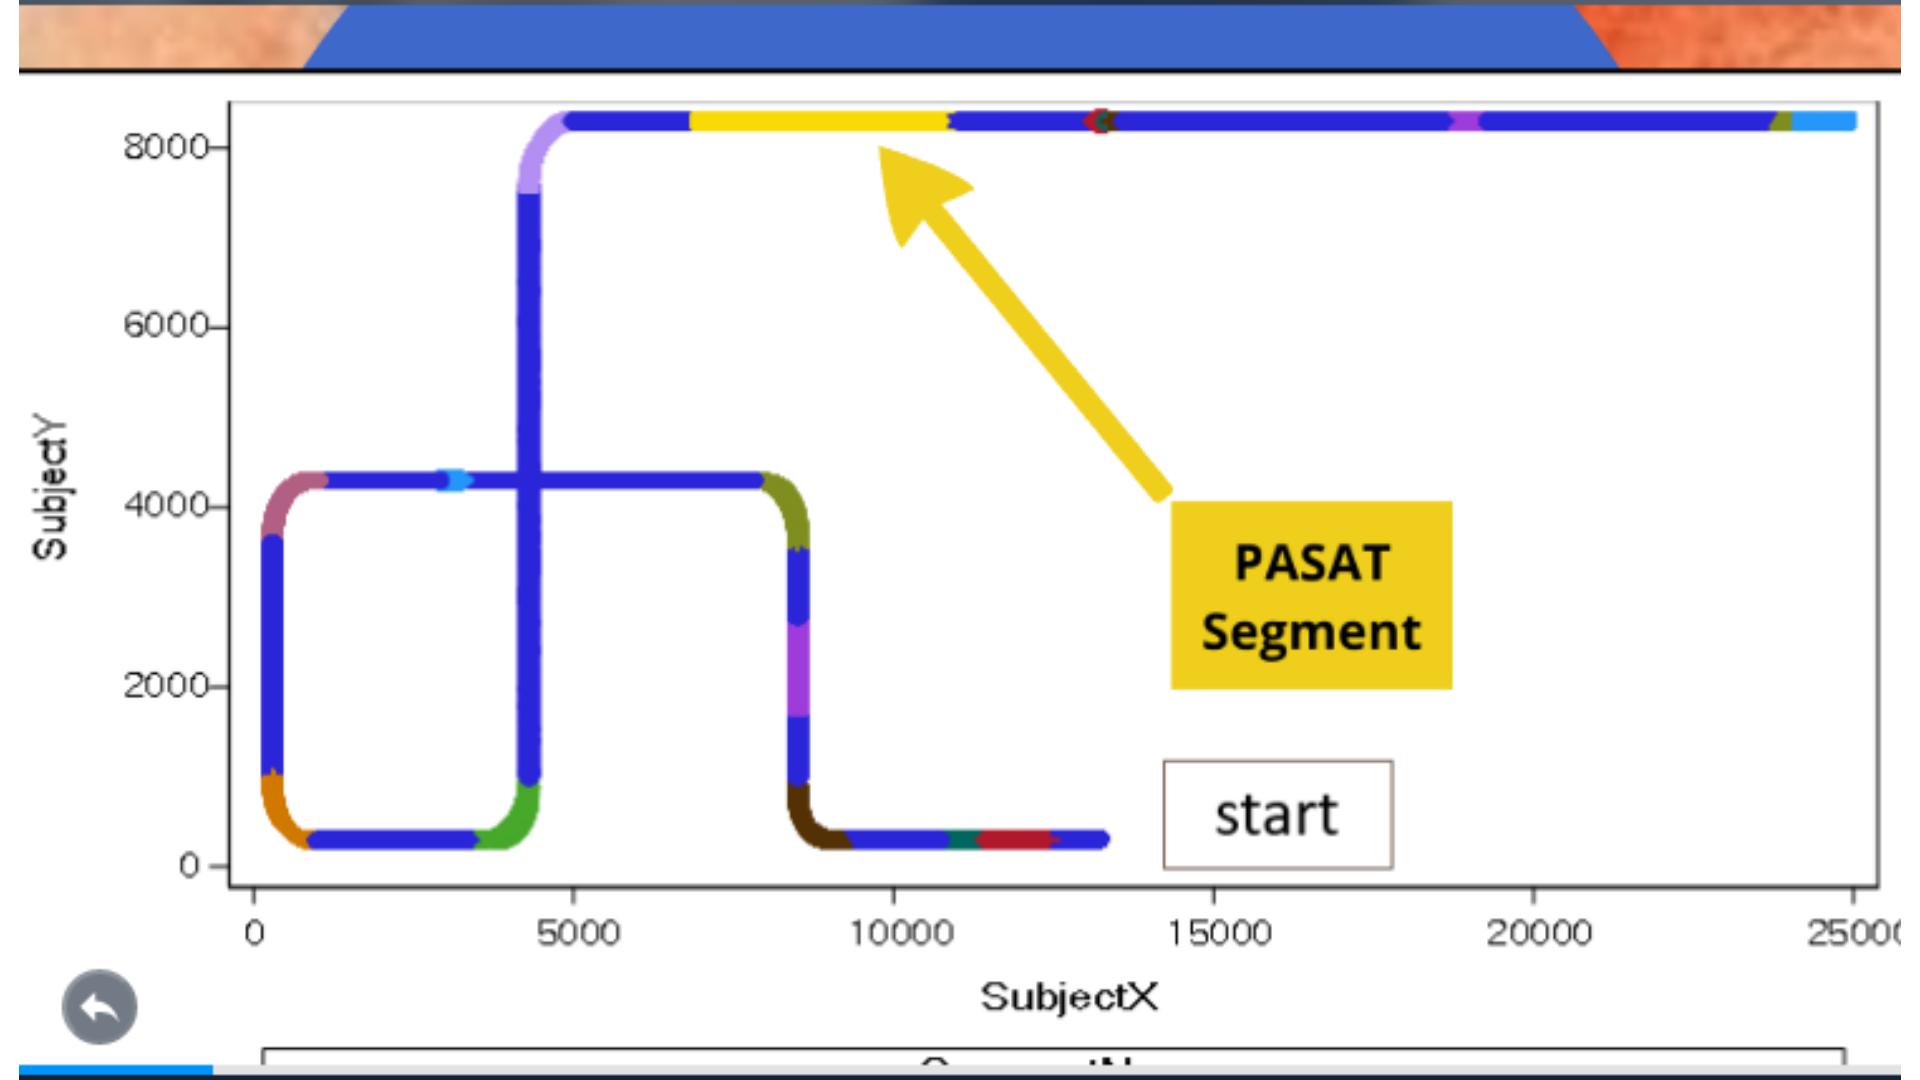

*Simulator for Interdisciplinary Research In Ergonomics and Neuroscience

Driving Route

PASAT*

A neuropsychological test that assesses "auditory information processing speed and flexibility, as well as calculation ability."

- negatively affected by increasing age, decreasing IQ, and low math ability.
- PD might accelerate impairment

About the
Test

Try it
out!

*Paced Auditory Serial Addition Test

The Process

Single digits are presented every 3 seconds where the patient must add each new digit to the one immediately prior to it.

Lane Position

Lane Position (**LanePos**) is the position of the center of the vehicle within the lane.

Lane Indicator (**LaneInd**) is the actual lane the subject is in while driving.

- Lane 1 is the default lane

Lane Crossing

Lane crossing is when part of the car crosses the lane

- In our study, 1 lane crossing is defined when a person crosses into another lane for "multiple frames at a time consecutively."

Coding: This is when the LanePos $> .92$ meters from the center.

*.92m is based on car and width of the lane

In Detail

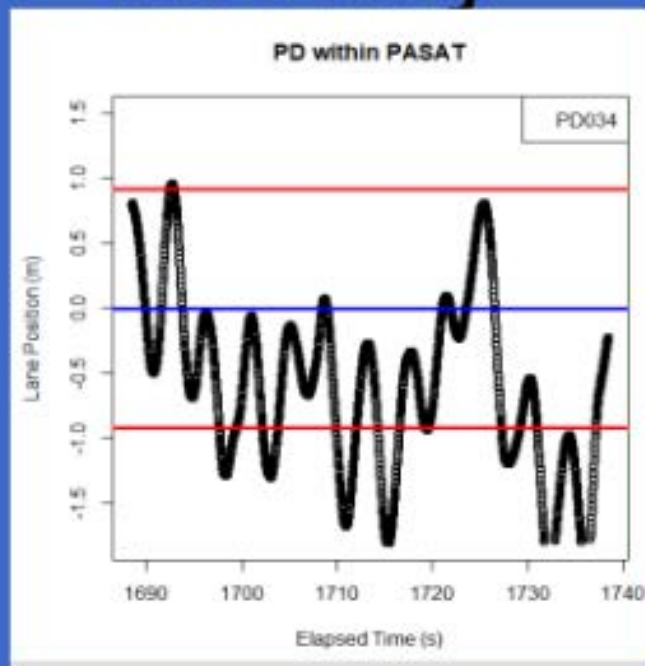

PD

vs

Control

Guess the number of
lane crossings:

Lane Position (m)

-1.5

8 Total Lane Crossings

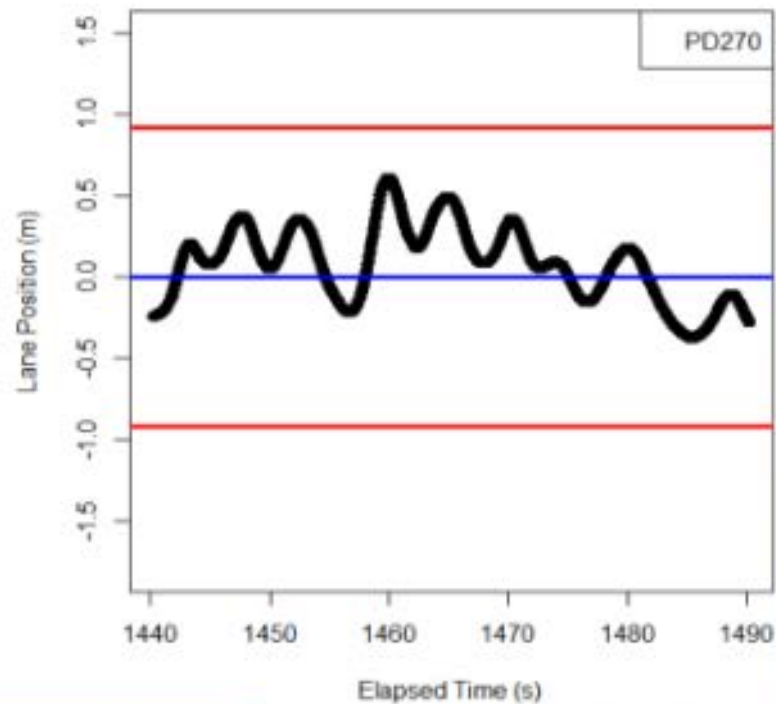

PD vs Control

PD within PASAT

Control within PASAT

PD within PASAT

SDLP - standard deviation lane position

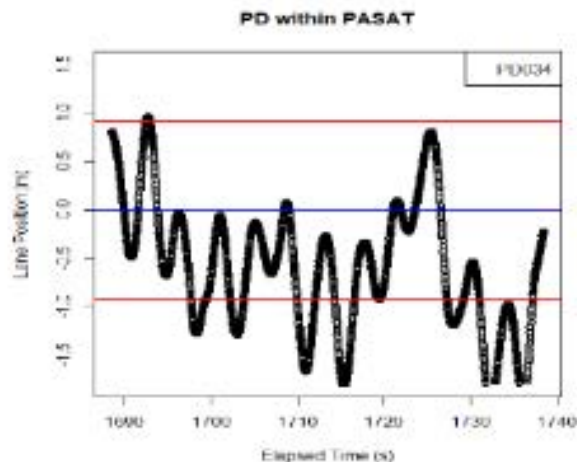

MAD_rel - mean absolute deviation (based on their LanePos mean)

MAD_0* - mean absolute deviation (based on 0)

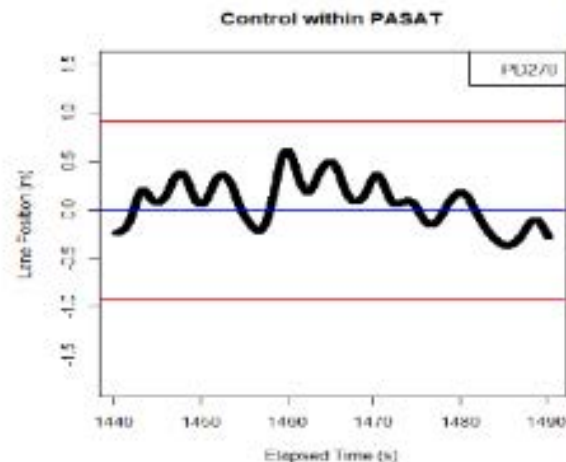

LaneC* - number of lane crossings

Recall the two previous subjects...

PD034

PD270

<i>MAD_0</i>	0.739	0.209
<i>MAD_rel</i>	0.587	0.188

Objective

- Former graduate student, Sean Devries, investigated the effect of PASAT among PD and Control subjects.
- Our objective was to replicate and extend his research given access to "year 3" data.

Questions

Data
Cleaning

Our Questions to Consider

- **Were PD and controls different during PASAT stretch? Straight stretch?**
- **Were PD subjects affected by PASAT task? How about controls?**
- **Were PD subjects affected by the PASAT task to a different degree than the Control subjects?**

Cleaning up the Data

Extracted two subsets from each subject:

- From PASAT and Straight sections
- 1500 frames each

Excluded subjects if:

- Not long enough PASAT or Straight segment
- NAs in LanePos for the subsets

**Data
Table 1**

**Data
Table 2**

Table 1. MAD_0 for 66 PD subjects and 59 control subjects in Year 1

	PASAT	Straight	Difference (P-value)	CI (95%)
<i>PD</i>	0.345	0.356	-0.011 (0.512)	(-0.045, 0.023)
<i>Control</i>	0.249	0.274	-0.025 (0.035)	(-0.049, -0.002)
<i>Difference (P-value)</i>	0.096 (< 0.001)	0.082 (< 0.001)		
<i>CI (95%)</i>	(-0.142, -0.051)	(-0.124, -0.040)		

Table II. Lane Crossing for 66 PD subjects and 59 control subjects in Year 1

	PASAT	Straight	Difference (P-value)
<i>PD</i>	51	59	-8 (0.380)
<i>Control</i>	12	13	-1 (0.894)
<i>Difference (P-value)</i>	39 (0.001)	46 (0.002)

Our Objective:

As an extension of Sean's research, we compared data from Year 1 to Year 3

- Year 3 is a subset of PD subjects from Year 1

Questions

Table 3

Table 4

Questions to Consider

- Was there a difference for PD subjects during Straight stretch between Year 1 and Year 3? How about for PASAT stretch?
- Were PD subjects affected by the PASAT in Year 3? Year 1?
- Was the amount of effect (due to PASAT) in PD subjects different in Years 1 and 3?
- Was the amount of effect (due to PASAT) in PD subjects during Year 1 associated/ correlated with the effect in Year 3?

Table III. MAD_0 for 20 PD subjects in Year 1 vs. Year 3

	PASAT	Straight	Difference (P-value)	CI (95%)
Year 1	0.354	0.316	0.038 (0.276)	(-0.033, 0.109)
Year 3	0.370	0.365	0.005 (0.878)	(-0.064, 0.075)
Difference (P-value)	0.017 (0.678)	0.050 (0.105)		
CI (95%)	(-0.101, 0.067)	(-0.111, 0.011)		

Table IV. Lane Crossing for 20 PD subjects in Year 1 vs. Year 3

	PASAT	Straight	Difference (P-value)
Year 1	8	8	0 (1.000)
Year 3	11	24	-13 (0.015)
Difference (P-value)	3 (0.345)	16 (0.003)

To summarize...

- Appears to be no difference between PASAT and Straight for either PD or controls
- PD subjects have more variation in lane position than controls
- PD subjects in Year 3 make more lane crossings than in Year 1
- Year 3 PD subjects make more lane crossings in the Straight segment than the PASAT segment

Limitations

Acknowledgments

References

Questions

Limitations

- Perhaps some PD subjects did not return for Year 3 because their condition had worsened since Year 1
- Can't compare Year 3 PD subjects with Year 3 Controls
- Small sample size ($n=20$) in Year 3 which leads to poor power
